

# Finite Element Analysis of Radius and Ulna

Eli Pavlatos

April 24, 2013

# Outline

- Review bone biomechanics
  - bone behavior during fracture
- Stress analysis concepts
  - properties of bone for models
- Fracture simulations
- Analysis results
- Conclusion

# Why Bones Break

- Key relationship: force applied to a structure and displacement

$S$  → stiffness

$F_u$  → ultimate force

$U$  → work to failure

$d_u$  → ultimate displacement

# Why Bones Break

- Re-express force and displacement as stress and strain

- Stress  $\sigma = \frac{F}{A} = \frac{N}{m^2} = Pa$

- 1 Pa  $\approx$  1 apple on square meter tabletop

- Strain  $\varepsilon = \frac{\Delta l}{L}$

- ratio of lengths so unitless

# Why Bones Break

- Similar to force-displacement curve
- $E$  = intrinsic stiffness
- Strength is intrinsic property of bone
- Force required to break varies with bone size
- Post yield = permanent

# Analysis Concepts

- Young's Modulus
- Shear Modulus
- Poisson's Ratio
- No density

$$E = \frac{F_n/A}{\epsilon_l}$$

E = Young's modulus

$F_n$  = force normal to faces

A = area

$\epsilon_l$  = linear strain

# Analysis Concepts

- Young's Modulus
- Shear Modulus
- Poisson's Ratio
- No density

$$S = \frac{F_p/A}{\epsilon_s}$$

S = shear modulus

$F_p$  = force parallel to faces

A = area

$\epsilon_s$  = shear strain

# Analysis Concepts

- Young's Modulus
- Shear Modulus
- Poisson's Ratio
- No density

$$\nu = -\frac{\epsilon_t}{\epsilon_l}$$

$\nu$  = Poisson's ratio

$\epsilon_t$  = transverse strain

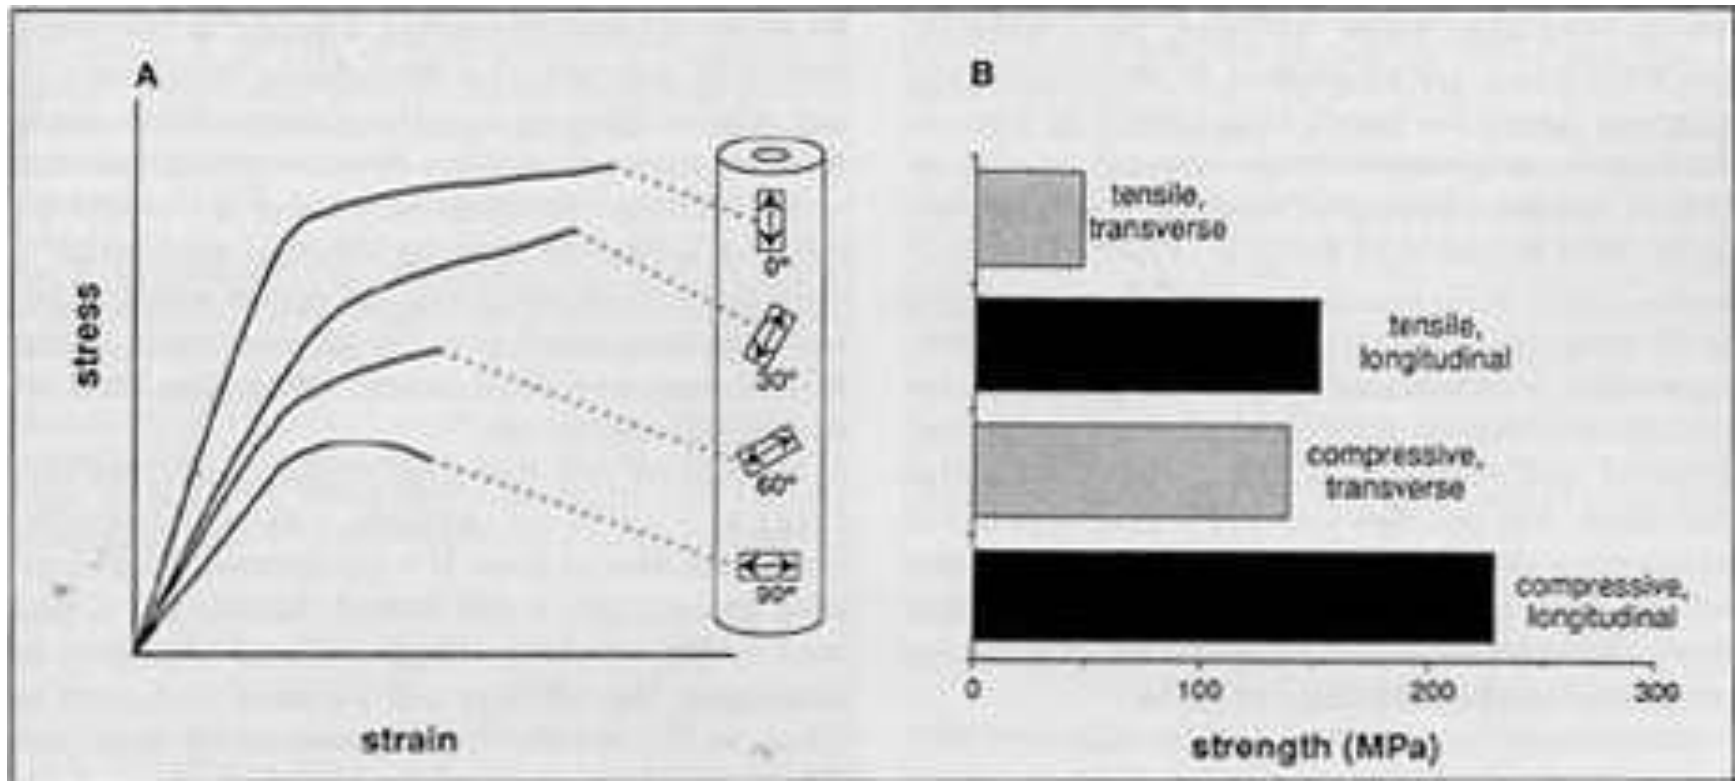

$\epsilon_l$  = longitudinal or axial strain

# Analysis Concepts

- Ultimate stress increases from transverse to longitudinal force
- Also dependent on tensile or compressive force

# Analysis Concepts

- Bone property values

	Longitudinal	Transverse
Young's Modulus	17 GPa	11.5 GPa
Shear Modulus	3.6 GPa	3.3 GPa
Poisson's Ratio	0.6	0.3

- Ultimate stresses:

- Longitudinal compression: 200 MPa
- Longitudinal tension: 140 MPa
- Transverse compression: 130 MPa

# Radius Catching Fall

- Hold proximal end fixed
- Forces applied to underside of distal end
- Expected stresses:
  - Compression on top near constraints
  - Tension on opposite side

# Radius Catching Fall

Stress ZZ

# Radius Catching Fall

- Von Mises Stress: combines linear and shear stresses from all directions into one value
- Max compression: 180 MPa – 200 MPa
- Max tension: 140 MPa – 160 MPa
- Fracture from tension most likely
- Applied force of 1160 N

# Ulna Catching Fall

- Max compression and tension:  
140 MPa – 156 MPa
- Tension only cause of fracture
- Applied force  
of 1610 N

# Radius Middle Load

- Proximal and distal ends fixed
- Load applied at midpoint of bone
- Expected stresses:
  - Compression/tension near constraints
  - Transverse compression at midpoint

# Radius Middle Load

Stress ZZ

# Radius Middle Load

- Max compression: 130 MPa – 145 MPa
- Max tension: 72 MPa – 87 MPa
- Fracture near center due to compression
- Applied force of 4720 N

# Ulna Middle Load

- Max compression: 125 MPa – 140 MPa
- Max tension: 140 MPa – 156 MPa
- Fracture near midpoint from compression
- Fracture from tension at wrist
- Applied force of 7450 N

# Radius

## Compress Ends

- Proximal end fixed
- Rest of bone limited to motion along z-axis
- Expected stresses:
  - compression throughout bone

# Radius Compress Ends

Stress ZZ

# Radius Compress Ends

- Max compression: 200 MPa – 223 MPa
- No tension
- Fracture near center due to longitudinal compression
- Applied force of 34,200 N

# Ulna Compress Ends

- Max compression: 200 MPa – 223 MPa
- No tension
- Fracture more toward distal end than for radius
- Applied force of 40,200 N

# Radius Twist

- Proximal end fixed as before
- “Force Couple” used to simulate twist
- Expected stresses
  - Torsion around z-axis

# Radius Twist

Stress YZ

# Radius Twist

- Ultimate stress = 49 – 68 MPa
- Max torsion: 45 MPa – 68 MPa
- Fracture risk for much of bone
- Applied force of 3020 N
- Torque of 54.66 N·m

# Ulna Twist

- Use region with only torsion stress
- Max torsion: 45 MPa – 68 MPa
- Fracture from torsion near middle
- Applied force of 4,400 N
- Torque of 78.59 N·m

# Summary of Forces

	<b>Radius</b>	<b>Ulna</b>
<b>Catching Fall</b>	1,160 N	1,610 N
<b>Mid</b>	4,720 N	7,450 N
<b>Comp</b>	34,200 N	40,200 N
<b>Stretch</b>	23,895 N	28,100 N
<b>Twist</b>	54.66 N·m	78.59 N·m

# Conclusion

- Was able to find fracture locations in radius and ulna for different simulations
- Resulting forces agreed with accepted models of bone anisotropy
- Ulna required larger forces
- Due to bone size and shape possibly described by Wolff's Law
  - bone in a healthy person or animal will adapt to the loads under which it is placed

# Thank You

- Dr. Voytas
- Dr. George
- Dr. Williams

Questions?

# Radius

## Stretch Ends

- Same constraints used as in compression
- Direction of force flipped
- Expected stresses:
  - Tension along entire bone

# Radius Stretch Ends

Stress ZZ

# Radius Stretch Ends

- No compression
- Max tension: 140 MPa – 156 MPa
- Fracture due to longitudinal tension
- Similar to position of compression fracture
- Applied force of 23,895 N

# Ulna Stretch Ends

- No compression
- Max tension: 140 MPa – 156 MPa
- Fracture again closer to wrist
- Applied force of 28,100 N

# Analysis Basics

- Stress  $\sigma = \frac{F}{A}$

$$\frac{N}{m^2} = Pa$$

$$\sigma = \sqrt{0.5 \left[ (\sigma_x - \sigma_y)^2 + (\sigma_y - \sigma_z)^2 + (\sigma_z - \sigma_x)^2 \right]} + \sqrt{+ 3(\tau_{xy}^2 + \tau_{yz}^2 + \tau_{zx}^2)}$$

- Strain  $\varepsilon = \frac{\Delta l}{L}$

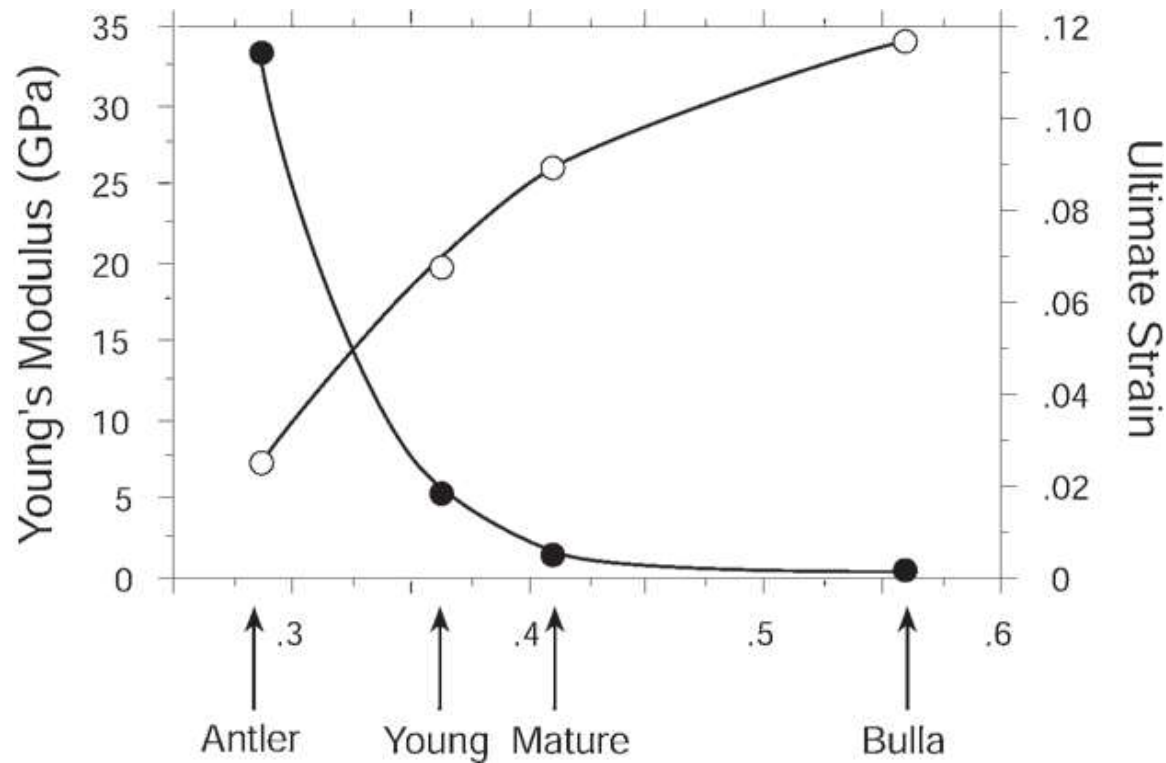

# Why Bones Break

- Biomechanical status of bone may be poorly described by just one of these properties
- Osteopetrotic patient
  - stiff, but brittle
- Young child
  - poorly mineralized and weak, but ductile

# Why Bones Break

- Inverse relationship between Young's modulus and ultimate strain
- Antler:  $\downarrow$  mineralization,  $\uparrow$  strain,  $\downarrow$  E

# Why Bones Break

- For my project, using curve for typical bone strength
- Will be looking for ultimate strength value given by program

# Current Model

Displacement Magnitude

# Current Model

Stress ZZ

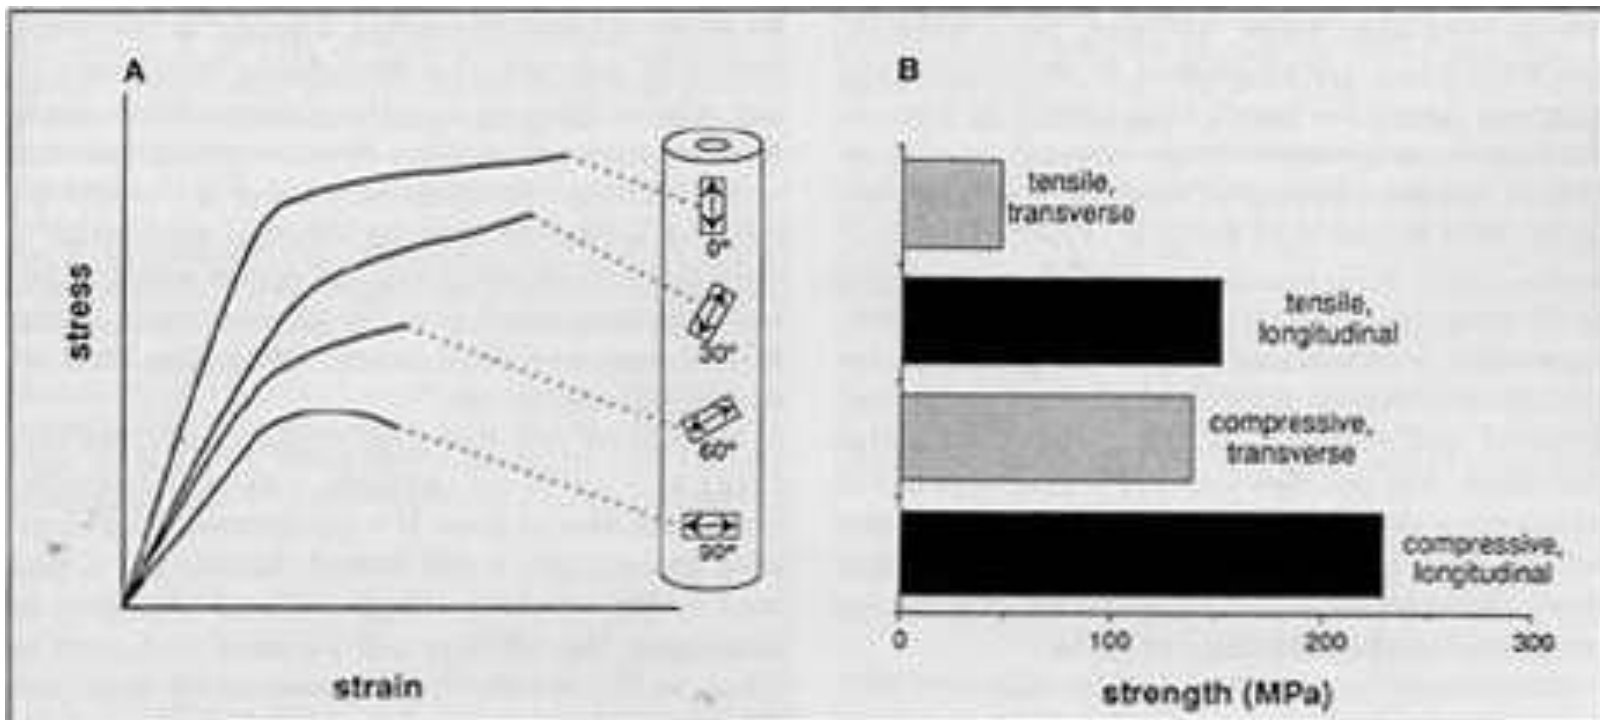

# Future Work

- Want to find stresses necessary to cause fractures of arm bones
- Current issues:
  - Thickness of the model
  - Obtaining sensible units
  - Creating realistic fracture scenarios

# Future Work

- Want to consider the anisotropic nature of bone

# Conclusion

- Bone fractures depend on multiple factors
- Want to find fracture point by examining maximum stress
- Next step is to get meaningful units and realistic fracture models
- Then want to consider anisotropic behavior

# FEA Review

- FEA is numerical method which provides solutions to difficult problems
  - stress analysis, fluid flow, heat transfer, etc.
- Math behind analysis relies heavily on use of matrices
- LISA and other programs allow complex computations to be carried out quickly
- Want to use LISA to perform static analysis on bone fractures

# FEA Review

- Beam Example

Node 54 X 5 Y 4 Z 0 stressxx 46.872266646973

Node 10 X 5 Y 0 Z 0 stressxx -46.8726816675875

# Why Bones Break

1. Ultimate tensile strength
2. Yield strength
3. Proportional limit stress
4. Fracture
5. Offset strain  
(typically 0.2%)
